

*I'm*

*Manager*

*I'm Trying To*

The basic idea is o move away from trying to augment water supply through construction and extraction and instead of the understand the centrality of managing what we have been blessed with sustainability and equitably. This smart idea can solve our water problem & fundamentally change our India

*But*

The center also needs to incentive & facilitate state got to move towards participatory irrigation management. It should release funds for irrigation projects only on the common condition that states will undertake these reforms. "No reform, No money" is the smart way to go

*Because*

India faces an even more serious crisis of mismanaging groundwater-the main souree of water , accounting for 80 percent domestic water consumption and the two-thirds of agricultural use

*Which Makes Me Feel?*

India needs a complete relook at it's flood management strategies that have overly relied on building dams and constructing embankments , which appear to have only aggregated the problem.
